

# Don't Track the Tack!

On the day of paving asphalt, please do not walk on the pavement. Prior to placing new asphalt, the Contractor will spray a layer of tack coat on the pavement which is used to bond layers of pavement together. This is a thin layer of a bonding liquid that will stick to your shoes and you will inadvertently track it onto the existing concrete or paver stones. We need to avoid this as much as possible so please avoid walking on the wet tack coat.

*Your help is greatly appreciated!*
